Climate Justice in Biology, Exposure Science, and Epidemiology
What's in this module?

Contents
This module demonstrates how biology can inform climate justice and how climate justice can help create more inclusive biologists. Case studies span from general biology to microbiology and epidemiology and the broader field of exposure science.

Activities
4 readings
1 activity

Key Resources
- *An applied environmental justice framework for exposure science* (Van Horne et al., 2022)
- *Conducting Culturally Responsive Research Across Borders* (Lahman, 2022)
- *Pervasive structural racism in environmental epidemiology* (Perry, 2021)
Learning Objectives

01 Recognize how climate justice can influence biology

02 Understand the CJ approach to biological research

03 Identify the importance of microbiology in climate science

04 Discover how you can address inequalities with biology
Introduction

PART 1
What is Climate Justice?

Definition
Climate justice is both a term and a movement which recognizes that climate change has unequal social, economic, health, and other negative impacts on people, with an emphasis on its impacts on underprivileged populations (Simmons, 2022).

Discuss with a partner
- Do you think this definition is complete? What would you add?
- Can you think of examples of climate justice in your community, country, or the world?
- How do you think biology can help the climate justice movement?
Climate Justice through Biology

Why climate justice is important in biology (iSEE)
Understanding the biological impacts of climate change is important for creating appropriate, holistic responses using:

- Soil science
- Microbiology
- Public health and epidemiology
- Animal and plant responses to heat and extreme weather

Discuss this quote as a class
“the field of science itself will have to reconcile its shameful past and revisit the reprehensible displays of racially driven confirmation bias that form its foundations” –Ayana Elizabeth Johnson, All We Can Save
Alternative Approaches to Biology Research

PART 2
Review: An applied environmental justice framework for exposure science

How to advance biology and exposure science with CJ

- Culturally and ethically responsible research methods
- Data and knowledge sharing
- Input from many perspectives
- Including different types of knowledge
- Respecting community's rights
- Prioritize research questions to benefit those most affected

Fig. 1: Roadmap for redefining exposure science strategies. (Van Horne et al., 2022)
DISCUSS THE POSSIBLE IMPLICATIONS AND EFFECTS OF THE READING

**Group and assign a question**

Divide the class into 4 groups and assign one question to each:

1. Why is this framework important for biologists?
2. How does this framework better prepare biologists for working with marginalized communities?
3. Why is conscious science important for communities?
4. How can we include communities in the research process?

**Small group discussion**

In your small group, spend 5–10 minutes discussing your assigned question. Take notes as you discuss, and nominate someone from your group to share your answers with the class.

**Class discussion**

Allow the first group to share the answers they came up with, and then open up the discussion to the class for 5–10 minutes. Repeat this for each group.
Review: Conducting Culturally Responsive Research Across Borders

Culturally responsive research includes:

- Explicit recognition, valuing, and discussion of cultural differences
- Validation of the worldviews of participants
- Explicit discussion of power differentials
- Acknowledgment that nontraditional research methods may work better with participants of differing cultural values

**ACTIVITY #2**

**DISCUSS THE POSSIBLE IMPLICATIONS AND EFFECTS OF THE READING**

**Group and assign a question**
Divide the class into 4 groups and assign one question to each:
1. How can you be a more culturally responsive researcher?
2. Do you think there are other guidelines not mentioned in the article?
3. What is the importance of culturally responsive research?
4. How is the framework for ethical exposure science similar and/or different to the guidelines to be a culturally responsive researcher?

**Small group discussion**
In your small group, spend 5-10 minutes discussing your assigned question. Take notes as you discuss, and nominate someone from your group to share your answers with the class.

**Class discussion**
Allow the first group to share the answers they came up with, and then open up the discussion to the class for 5-10 minutes. Repeat this for each group.
Activity #3
Read and Discuss With a Partner

Read
With a partner or in small groups, read *Microbiologists as Experts in Climate Change Conversations*

Discuss
After you read the article, spend 5-10 discussing these questions with your partner (or group):

• How can microbiologists advance the climate change discussion?
• What can microbiologists contribute to the fight for climate justice?

(Jansson & Hofmockel, 2019)

Climate change induces alterations in soil microbial communities. Bacteria, archaea and fungal hyphae are impacted by changes in temperature, precipitation, storms, soil organic carbon and greenhouse gases, leading to changes in community structure as indicated in the diagram by changes in color.
CJ in Biology Research Case Studies

PART 3
Background

From: Pervasive structural racism in environmental epidemiology

- Meta-analysis of studies of male infertility and environmental health to demonstrate how environmental epidemiology ignores racism in research and medical practice
- Paper illustrates "how failing to address racism neglects the health of entire populations"

"Failing to include populations who are Black, Indigenous, and people of color (BIPOC) in health research means researchers actually know very little about the effect of environmental contaminants on a range of population health outcomes"

Introduction

Currently, epidemiological biases in environmental epidemiology generate the full understanding of how racism's societal impacts directly influence health outcomes. The field continues to parameterize conditions of communities of color [1] without recognizing that these social forces are in fact root causes of many disease etiologies.

If public health researchers seek to achieve health equity for persons of all backgrounds, the impact of racism on health outcomes needs to be acknowledged, quantified, and addressed. This will require advancing paradigms that identify how racism affects both population health and the health research enterprise. To address racism in public health, our own racist structures need to be examined and dismantled.

Leading medical and public health institutions have long recognized that racism perpetuates health disparities [2, 3], numerous calls have been made over the last several decades to reform how race and racism are
Sperm counts are indicative of both fertility and general health. For decades, declines in Western sperm counts have been observed. Environmental toxins including lead, pesticides, air pollution and plasticizers are affect sperm counts, yet there is little data from POC participants in reproductive health studies despite often bearing the greatest pollutants.

Almost all that is known about population sperm health comes from White men only, very little has been recorded about sperm counts among people of color. The few studies including POCs have recorded lower semen values among Black men compared to other groups.

(Perry et al., 2021)
Solutions

01 Acknowledge racism in public health research
Address how racism has affected research findings in the past and how systemic racism still impacts research today

02 Include affected communities in decision-making
BIPOC scholars must hold leadership positions in science

03 Develop requirements and standards for discussing race in research
Create guidelines for how race and ethnicity can be used in research

04 Embrace a more holistic approach to analysis
Work beyond internal discipline boundaries

05 Partner with community members to conduct research
Empower study participants by giving them a say in how and what research is conducted

06 Improve training for researchers and students
Antiracism literacy can help researchers/professionals identify and analyze racism
GROUP DISCUSSION OF THE CASE STUDY

ACTIVITY #4

How can we address racism in epidemiological research?

What is missing in current research?

How can climate change exacerbate the inequalities in research representation?

Who is suffering as a result?

What do you think of the conclusions do the researchers come to?

Do you agree with the proposed solutions?

Discuss as a class

Spend about 15 minutes as a class discussing the key takeaways, arguments, and implications of the case study.

Guiding questions

• How can we address racism in epidemiological research?
• What is missing in current research?
• How can climate change exacerbate the inequalities in research representation?
• Who is suffering as a result?
• What do you think of the conclusions do the researchers come to?
• Do you agree with the proposed solutions?
Report on Integrating Biology into Climate Action

Prompt suggestion
Using the template to the right from the All We Can Save Project, identify ways you can include biology in climate justice policy, research, and personal actions.

Write a report detailing the steps that can be taken to integrate climate justice more deeply within biology, epidemiology or exposure science research or study. Consider how this could impact the widening circles of influence shown on the right.
